

Muhammad Khizar Reflection

The first few coding examples were easy to replicate and do. However, Example 2, where we were required to check if a number was positive, negative or zero required a npn install of the package so that prompt-sync would work, the document did not mention any of this so I was stuck for an hour or two until I finally installed the package and it worked just fine. Next was the actual portfolio exercise which was pretty easy to do. I asked the user to input num1 and num2 then what equation they wanted to do. Once done, I made a bunch of IF / ELSE IF / ELSE statements for equations depending on whether they chose to add, divide, etc.
